Subject:	redmine vs gravatar, https mixed content		
Description:	<p>Visiting most (all?) Bitfolk redmine issues Firefox indicates a https mixed content warning.</p> <p>The problem appear to be gravatar images being served by way of http://. Given that these gravatar urls now also work by way of https:// I assume the bug can be fixed by way of a fairly small code/config change.</p> <p>Example: http://www.gravatar.com/avatar/6ca383619c7b7c044ca9cde5d51bd6bf vs https://www.gravatar.com/avatar/6ca383619c7b7c044ca9cde5d51bd6bf</p>

I think I just needed to tell redmine that it is on a https host which seems to make it correctly tell its gravatar plugin to use https. I am seeing https links for these now and no warnings. Do you see same?

Yepp, that appear to have done the trick.

Great, thanks for noticing that.
