I think that a web interface to generate actual Nagios config is going to be a really difficult task.

However, I'm confident that we can get 80% of the way there with canned config snippets which can be added or removed.

For example, there can be standard checks like ping, ssh (ask what port), mysql (username, password), http, http vhost, https, and so on. These require minimal config info. More complex stuff could still be added by support ticket.
